

Having just read the article online in "InDailysa" re your section, I am in hope that something positive will come from the ideas the government is considering.

I have been living in Greenwith 5125 now since 1979 and have witnessed the decline in native species just in my garden and reserve opposite my home including:-

- New Holland honey eaters gone
- Wattle birds gone
- Pardalote birds gone
- I find dead/mutilated parrots in yard
- Blue tongue lizards gone
- Decline in skink lizards
- Preying mantis of different types gone

Once had three Koala visiting premises two years ago allegedly a neighbours dogs killed two, only one left

Biggest killer of native creatures are CATS

I believe that if people feed native wildlife in some states there is up to \$30,000 fine yet cat owners that let cats out

it has been calculated kill around 130 native animals/birds etc per year per cat with total immunity

CATS are not a native species they are all feral and all killers and until they are gone from the environment you will never, never stop the decline of Australian wildlife
